

MENTOR BLUEPRINT

Build Your Own Solo Leveling System for JEE Prep

A step-by-step plan for two students to design, build and ship a gamified study tracker — leaderboard, XP, ranks and AI-verified proof-of-work — from scratch.

TEAM SIZE	GOAL	STACK
2 Students + 5 Users	JEE Study Tracking	Next.js + Supabase + Claude

1 Lock the MVP

Don't build everything at once — ship the core loop first

CORE LOOP (V1)

- Add a task / daily quest (e.g. "Solve 20 Physics numericals")
- Submit a photo as proof when the task is done
- AI checks the photo looks legit for that task
- Points / XP awarded → leaderboard updates in real time
- Simple rank system (E → S rank, Solo Leveling style)

SKIP FOR NOW (SAVE FOR V2)

- Streak freezes
- Guilds / parties
- Push notifications
- Fancy animations
- Mobile app wrapper

2 Tech Stack

Optimized for "5 friends, free tier, fast to build"

LAYER	TOOL	WHY
Frontend	Next.js (React)	Works great with Claude in VS Code, huge community, easy to keep lag-free with good practices
Backend / DB / Auth / Storage	Supabase	Free tier, handles login, database, photo storage and realtime leaderboard updates in one place
AI photo verification	Claude API (vision)	Send the photo + task description, ask it to judge if the work is legit
Hosting	Vercel	Free, deploys straight from GitHub, auto-updates on every push

3 Data Model

Keep it simple — four tables is enough for v1

```
users → id, name, rank, total_xp
tasks → id, user_id, title, subject, xp_value, status
submissions → id, task_id, photo_url, ai_verdict, timestamp
xp_log → id, user_id, xp_change, reason, timestamp — for leaderboard history & streaks
```

4 Team Split

Vertical slices work better than "frontend vs backend" for two people

PERSON A

Product & Interface

- Auth flow
- Task creation UI
- Overall look & feel

PERSON B

Data & Intelligence

- Photo upload flow
- Claude API verification
- Leaderboard logic

Swap roles every week or two so you both learn the full stack, not just "your half".

5 GitHub + Discord Setup

Your two coordination hubs

GITHUB

- One person creates a **private** repo, invites the other as collaborator
- Use GitHub Issues as your to-do list — one issue per feature
- Two branches minimum: **main** (stable) and **dev** (daily work)
- Merge via pull requests so you both review each other's code

DISCORD (PRIVATE SERVER, 2-5 PEOPLE)

#dev-log

#bugs

#ideas

#motivation

Post XP milestones in **#motivation** too — fits the theme and keeps momentum up.

6 Build Order

Roughly 4–5 weekends to a working v1

- 1 **Project setup** + login for 5 fixed accounts
- 2 **Task creation** + basic XP / points logic
- 3 **Photo upload** + Claude vision verification
- 4 **Leaderboard** — realtime with Supabase
- 5 **Polish** — ranks, UI theme, animations, deploy

Next step: sketch the actual Next.js + Supabase folder structure and starter code as your first commit.
